Genomics:GTL Microbes for Research

May 2008*

The U.S. Department of Energy (DOE) Office of Science supports innovative, high-impact, peer-reviewed biological science to seek solutions to difficult DOE mission challenges. These challenges include finding alternative sources of energy, understanding biological carbon cycling as it relates to global climate change, and cleaning up environmental wastes. The Microbial Genome Program (MGP), initiated by DOE's Office of Biological and Environmental Research (BER) in 1994, has sequenced more than 485 microbial genomes and 30 microbial communities having specialized biological capabilities. Identifying these genes will help investigators discern how gene activities in whole living systems are orchestrated to solve myriad life challenges. The Genomics:GTL (GTL) program, begun in 2001, is devoted to mechanistically understanding how microbes use a variety of energy sources, process metals, cycle carbon and nutrients such as nitrogen, and ameliorate radiation damage. Using completed genome sequences and a systems biology approach, GTL's goal is to develop a set of comprehensive principles and models showing how living systems function and to help put that knowledge to work in biotechnological solutions to DOE mission challenges. GTL research is relevant to BER's new Bioenergy Research Centers, Climate Change Research Programs, and its Environmental Remediation Sciences Program.

Most microbes of interest to DOE are sequenced at the DOE Joint Genome Institute (JGI). Through the DOE JGI Community Sequencing Program, researchers anywhere can propose candidates for sequencing that bear on DOE missions in bioenergy, climate change, or bioremediation. Through the DOE-JGI Laboratory Science Program, scientists at DOE Laboratories are given the opportunity to propose candidates for sequencing that bear on DOE Lab missions. At the completion of any sequencing project, all data are made available to the entire community.

Current Status

*Due to rapid progress, this information is continually changing. Current status available:

Joint Genome Institute
www.jgi.doe.gov

Genomics:GTL
genomicsgtl.energy.gov

Sequencing Status Key:

- “New” – sequencing of organism has not started
- “Pending” – DNA is waiting to enter the production process
- “In production” – includes library creation and production sequencing
- “In assembly” – assembly in progress
- “In draft assembly” – first assembly, made without finishing the genome
- “In finishing” – postproduction work not carried out for all organisms
- “Incomplete” – not finished, further status unknown
- “Draft” – no further work planned
- “Finished” – sequencing completed

Category Key

- “Bioremediation” – cleanup of toxic wastes of importance to the DOE, generally radionuclides, metals, and some organic compounds
- “Carbon Cycling” – understanding carbon cycles in terrestrial or marine environments to predict sources and sinks of CO₂
- “Cellulose Degradation” – efficient conversion of biomass (cellulose, hemicellulose, or lignin) to products such as ethanol, methane, and hydrogen
- “Energy Production” – energy generation and development of renewable energy sources such as methane and hydrogen
- “Biotechnology & Applied Microbiology” – production of chemicals or enzymes to improve process efficiency
- “Technology Development, Pilot Projects” – demonstration of feasibility or fine-tuning of sequencing technologies
